

NSC offers insight into innovation

Patrick Strehle and a GC30 chain gill in the NSC fibre to yarn showroom specifically designed for customers to view completely assembled machines, see them running, and even enable them to test process their wool to see the end result and quality

A showroom where clients can view fully assembled machinery for the manufacture and processing of fibre and yarn - sounds like a good idea? Well, NSC fibre to yarn has done just that. The machines are fully operational and customers can assess the performance and suitability of the machinery before installation at their own

plant. The showroom is located at the NSC fibre to yarn factory in Guebwiller, France.

NSC fibre to yarn is a world leader in supplying the most advanced fibre and yarn processing machinery and it is therefore not surprising that such an innovative move would come from this company.

'Those interested in purchasing machinery can even send their wool to us for a test run on this machinery so that we can demonstrate the results that can be achieved. We change the machines in our show room every 6 month or so to enable customers to see the latest technology as it is developed', says Patrick Strehle, Commercial Director at NSC fibre to yarn.

'We have developed a variety of textile machinery for fibre to yarn for a wide range of customers, both small and big. Our showroom allows our customers to familiarise themselves with the inner workings of our newest machines and see how these machine keep up with the latest market demands and trends'.
